Summary

Full-stack web engineer, founder and only engineer of Femabrás, a trilingual web platform for Angola on Next.js, React, TypeScript and Go. It went live 15 weeks after its first commit and shipped 16 production releases in its first 7 weeks. I own features end to end, from the brief and API contract to the UI, tests, release and follow-up, and I write the tradeoffs down before I build.

Skills

Frontend	React 19, Next.js 16 (App Router, server rendering), TypeScript, JavaScript, HTML, CSS, Tailwind CSS 4, TanStack Query, Zustand, next-intl, MapLibre GL, Server-Sent Events
Backend	Go (Gin, GORM, Asynq), REST API design, PostgreSQL, Redis, JWT sessions with refresh-token rotation, Google OAuth, rate limiting
Delivery	GitHub Actions, Docker Compose, GHCR, Caddy, Cloudflare (DNS, R2), Hetzner, restic backups to Backblaze B2
Practice	Responsive and accessible UI, i18n and SEO, automated tests (node:test, Go), CI quality gates, architecture decision records, AI-assisted development (Claude Code), Adobe Illustrator

Experience

Founder & Full-Stack Engineer · Femabrás

Mar 2026 – Present

femabras.com · Luanda, Angola

Web platform for Angola in Portuguese, English and French: football predictions, four browser games including real-time chess, a dashboard for partner tipsters and an owner console.

- Built real-time online chess: invite links, Server-Sent Events that push each move to both players and to spectators, server-side move validation, and optimistic moves in the React client that roll back if the server rejects them.
- Built the predictions engine in Go, a Poisson score model using team strengths for leagues and Elo ratings for tournaments, and a backtest that grades picks with the production code. Limited multi-leg picks to tournaments after league slips hit 39–45% against 55–67% predicted (tournaments: 59.8% vs 56.7%).
- Set up CI/CD in GitHub Actions: each push runs the gate, builds images to GHCR and deploys to a password-gated staging site; production promotes the exact image verified there, and a tag with no changelog entry is refused.
- Fixed a Google Sign-In failure that only hit visitors landing directly on sign-in or sign-up: server rendering wrote the API's internal Docker hostname into the link. Browser-facing URLs now use a separate public origin.
- Made missing translations fail the build with a check that every string the code uses exists in all three languages, added after untranslated keys reached the chess board in every locale.
- **Built, pre-release:** an ATM finder on MapLibre GL with a self-hosted, Angola-only vector map (PMTiles on Cloudflare R2); silent session refresh with rotating refresh tokens in the Next.js proxy; private audio streaming through presigned URLs; a Gemini assistant behind a rule-based router with daily caps.
- Record each significant decision in an architecture decision record (50+). Work AI-assisted: spec and ADR first, Claude Code implements in plan mode, every diff reviewed, and nothing committed until formatting, vet, tests, a vulnerability scan, the i18n check, lint and a production build pass.

Education

B.Tech, Computer Science and Engineering · GD Goenka University, Gurugram, India

2019

Languages and interests

Languages: Portuguese (native), English (professional working proficiency), French, Spanish and Hindi (basic)

Interests: music production (Logic Pro X), graphic design, football, basketball, snooker
